

CLAIM AMENDMENTS

IN THE CLAIMS

This listing of the claims will replace all prior versions, and listing, of claims in the application or previous response to office action:

1. **(Currently Amended)** An arrangement for determining a relative movement of a chassis and a vehicle body of a wheeled vehicle, said vehicle body being movably connected to the chassis, comprising

- a measuring entity which is arranged or can be arranged in the wheeled vehicle, wherein the measuring entity is configured to measure three respectively perpendicular linear accelerations of the wheeled vehicle and at least two rotational speeds, each relating to a rotational movement or a component of a rotational movement about a coordinate axis of the wheeled vehicle, wherein the at least two coordinate axes run perpendicularly to each other, and

- an analysis entity which is combined with the measuring entity and is operable to determine a momentary movement position of the relative movement using the three linear accelerations and the at least two rotational speeds, **and without using input from wheel displacement sensors.**

- wherein the analysis entity comprises a calculating unit which is operable to calculate a plurality of momentary movement positions using the at least two rotational speeds and the three linear accelerations, and

- wherein each of the movement positions is a measure for a distance between the vehicle body and at least one wheel of the chassis.

2. **(Previously Presented)** An arrangement according to claim 1, wherein the measuring entity has acceleration sensors for measuring the linear accelerations and rotational speed sensors for measuring the rotational speeds, and wherein the acceleration sensors and the rotational speed sensors are parts of a preprepared hardware unit which is configured for installation in the wheeled vehicle.

3. (Previously Presented) An arrangement according to claim 1, wherein the measuring entity is configured such that the three linear accelerations can be measured as measured variables which are linearly independent of each other.

4. (Previously Presented) An arrangement according to claim 1, wherein the measuring entity is configured such that the at least two coordinate axes run perpendicularly to each other as a pair in each case.

5. (Previously Presented) An arrangement according to claim 1, wherein the analysis entity includes a calculating unit which is configured to calculate the momentary movement position with reference to a spring suspension, in particular a spring suspension which is moderated, between at least one of the wheels of the wheeled vehicle and a vehicle body.

6. **(Currently Amended)** A method for determining a relative movement of a chassis and a vehicle body of a wheeled vehicle, said vehicle body being movably connected to the chassis, the method comprising the steps of:

- measuring three respectively perpendicular linear accelerations of the wheeled vehicle and at least two rotational speeds, each relating to a rotational movement or a component of a rotational movement about a coordinate axis of the wheeled vehicle, wherein the at least two coordinate axes run perpendicularly to each other;
- determining a momentary movement position of the relative movement using the three linear accelerations and the at least two rotational speeds, **and without using input from wheel displacement sensors**; wherein
 - calculating a plurality of momentary movement positions using the at least two rotational speeds and the three linear accelerations, and wherein
 - each of the movement positions is a measure for a distance between the vehicle body and at least one wheel of the chassis; and
 - providing the distances as input variables of systems for at least one of adjusting and monitoring properties of the wheeled vehicle.

7. (Previously Presented) A method according to claim 6, wherein the linear accelerations are measured using acceleration sensors and the rotational speeds are measured using rotational speed sensors, and wherein the acceleration sensors and the rotational speed sensors are parts of a preprepared hardware unit which is arranged in the wheeled vehicle.

8. (Previously Presented) A method according to claim 6, wherein the three linear accelerations are measured as measured variables which are linearly independent of each other.

9. (Previously Presented) A method according to claim 6, wherein the at least two coordinate axes of the rotational speeds run perpendicularly to each other as a pair in each case.

10. (Previously Presented) A method according to claim 6, wherein the momentary movement position is calculated with reference to a spring suspension, in particular a spring suspension which is moderated, between at least one of the wheels of the wheeled vehicle and a vehicle body.

11. **(Currently Amended)** An arrangement for determining a relative movement of a chassis and a body of a vehicle, said vehicle body being movably connected to the chassis, comprising:

- a measuring entity configured to measure three respectively perpendicular linear accelerations of the vehicle and at least two rotational speeds, each relating to a rotational movement or a component of a rotational movement about a coordinate axis of the vehicle, wherein the at least two coordinate axes run perpendicularly to each other, and
- an analysis entity configured to determine a momentary movement position of the relative movement using the three linear accelerations and the at least two rotational speeds, **and without using input from wheel displacement sensors,**
- wherein the analysis entity comprises a calculating unit operable to calculate a plurality of momentary movement positions using the at least two rotational speeds and the three linear accelerations, and
- wherein each of the movement positions is a measure for a distance between the body and at least one wheel of the chassis.

12. **(Previously Presented)** An arrangement according to claim 11, wherein the measuring entity has acceleration sensors for measuring the linear accelerations and rotational speed sensors for measuring the rotational speeds.

13. **(Previously Presented)** An arrangement according to claim 12, wherein the acceleration sensors and the rotational speed sensors are parts of a preprepared hardware unit which is configured for installation in the wheeled vehicle.

14. **(Previously Presented)** An arrangement according to claim 11, wherein the measuring entity is configured such that the three linear accelerations can be measured as measured variables which are linearly independent of each other.

15. (Previously Presented) An arrangement according to claim 11, wherein the measuring entity is configured such that the at least two coordinate axes run perpendicularly to each other as a pair in each case.

16. (Previously Presented) An arrangement according to claim 11, wherein the analysis entity includes a calculating unit which is configured to calculate the momentary movement position with reference to a spring suspension, in particular a spring suspension which is moderated, between at least one of the wheels of the vehicle and the body.
